Phone Numbers

Phone Numbers

14.8 - Tokenizing Telephone Numbers

Write an application that inputs a telephone number as a string in the form of (555) 555-5555. The application should use the String class method **split** to extract the area code as a token, the first three digits of the phone number as a token, and the last four digits of the phone number as a token as well. The seven digits of the phone number should be concatenated into one string. Both the area code and the phone number should be printed. Remember that you will need to change the delimiter characters during the tokenization process.

Due date: 4/26/16 no later than 11:59PM, Early Bird Bonus Submit before 11:59PM on 4/18/2017
